

Conservation road trip

Join TEP on an EPIC road trip across South Africa visiting CONSERVATION organisations.

You have the choice to visit one, two or all of these NPOs.

A marine research and conservation organisation.

The trust strives to protect:

- the endangered African Penguin whose numbers are at an all-time low;
- the world's densest populations of the vulnerable Great White Shark;
- the globally important breeding and calving grounds of the Southern Right Whale.

Hands-off wildlife research and monitoring organisation.

Based in the southern region of South Africa in the Cape Floristic Region, a biodiversity hotspot and the most diverse floral kingdom in the world. Research focuses on regional conservation management, behavioral ecology, and human-wildlife coexistence.

Ecological research and conservation education organisation.

NVT is a small community driven NPO which works in four main areas:

- ecological research
- environmental education
- community awareness
- conservation

Community conservation education organisation.

The Foundation's Environmental Education programme aims to cultivate an understanding and love of nature in the children who visit the Amakhala Conservation Centre (ACC), thus increasing awareness and concern so that future generations can enjoy our natural habitats.

Rhinos and hippo conservation organisation.

With rhino orphans urgently in need of a home, the Zululand Conservation Trust stepped up, deciding to shoulder the responsibility and costs. They built these babies a suitable, comfortable facility to call home. It is their mission to ensure they are released back into the wild, where they belong.

Wildlife rehabilitation and cheetah breeding organisation.

The Hoedspruit Endangered Species Centre strives to support conservation within a sustainable ecosystem by focusing on the survival of endangered species through the maintenance of diverse bloodlines of cheetahs, rehabilitation of rhinos, education of communities about conservation, and focussed research for long-term sustainability of endangered species.

Giraffe research and bush living organisation.

They focus on the management and conservation of the fauna and flora of the Mogalakwena River Reserve. The main research focus areas include reserve management, wildlife management, habitat management, species abundance monitoring, wildlife ecology and behavior, environmental observations and eco-tourism.
